Monitoring Analytics

Issues

- **From January 1, 2008, through November 2010, Not Willing to Pay Congestion (NPC) transactions have accrued \$12.5 Million in uncollected congestion charges.**
 - **These dollars would have been available to fund FTRs.**
- **Selection of internal sources and sinks for such transactions do not reflect actual energy flows.**

Uncollected Congestion Charges

Discussion

- **Recent EES Modifications – September 2010**
 - **Analyzes transaction with 20 minutes notice to determine if congestion is present.**
 - **If so, the transaction is curtailed prior to start**
 - **If not, the transaction is loaded**
 - **Real-Time monitoring for congestion**
 - **If congestion occurs, the transaction is curtailed at next interval**
 - **Congestion charges are not paid for this period that the transaction is loaded**
 - **If no congestion occurs, the transaction continues to flow**

Proposed Solution from MIC

- **Charge congestion for intervals while loaded**
- **Require source and sink for real-time external transactions to be submitted only at PJM interfaces**
