AND/OR ADDENDUM

FOR CONSIDERATION:

*“Each EDC must have metering in place that meets the tariff requirements for each customer. A single POI meter can be utilized if the metering is discrete enough to differentiate both consumption and injections in compliance with tariff requirements.*

*For NEM customers, tariffed rates may be different for that service from other DER activity and therefore require the installation of additional metering equipment.*

*Each distribution utility has the requirement to maintain the security and reliability of its respective system and may have metering requirements for injectable devices to meet that obligation.”*
